

HAYSTACK® Online for Windows v2.01

A Comprehensive Source,
Parts, and Logistics
Management System

New Functionality

New, modern display uses a multi-document interface featuring customizable toolbars, a shortcut menu bar, and tiling options. This example allows the user to compare characteristics of two different NSNs. You can also now create macros for repetitive searches.

- **A new and exclusive IHS end item search** allows users to search in one place for end item data codified from within the FLIS. Air Force (MMAC), Navy (SMIC), and Army (AAMC) end item codes are searchable under one query. Codes and definitions are displayed for ease of selection.
- **Search across all databases** by using the database group searches. Searches can be initiated by part number, NIIN, or keyword, and eliminate the need for repetitive searches utilizing multiple databases.
- **A company name display** is conveniently listed in the results list, eliminating the need to open a CAGE record to identify company name.
- **Procurement History** has an FSC search as well as the ability to search by unit price to help you research and analyze market opportunity.
- **Increased cross-referencing** between databases on the NIIN and/or CAGE permits seamless, streamlined access between databases. Accessing additional content is now much easier.
- **PDF capabilities** allow you to print and download to PDF format. Look for this option under the Print icon/Printer output option.
- **An enhanced APL Database** links components to the next higher assemblies (or parent APLs) and links from parent APLs to components.
- **Context-sensitive help** definitions can be viewed and printed. Our popular drag-and-drop help replaces the need for shelves of DID's manuals.

HAYSTACK[®] Online for Windows v2.01

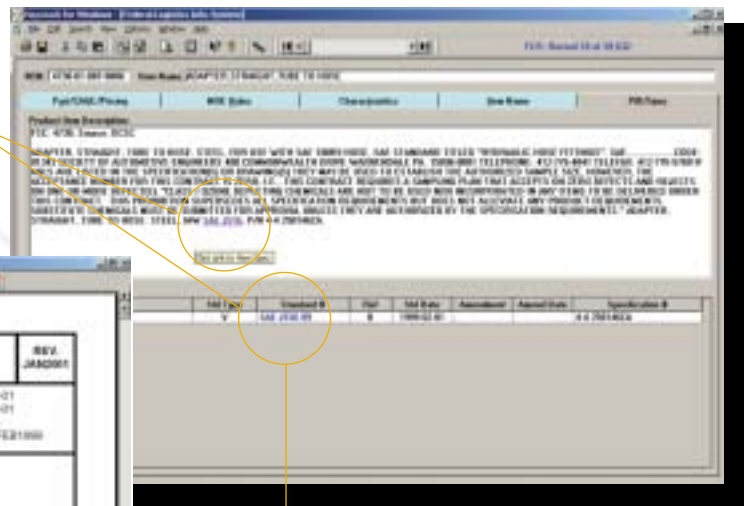

New Capabilities Increase the Power of HAYSTACK

HAYSTACK, the world's most comprehensive parts and logistics management system, is now better than ever, with added capabilities utilizing the latest technologies, custom outputs and reporting capabilities, and customizable interface functionality. **Look for these new product enhancements:**

New Content

- **The IHS Specs & Standards** integration with HAYSTACK facilitates seamless searching between information contained in both products without having to access each product separately.

Links to specifications and standards are indicated in blue text in the part number field, technical characteristics data, and from within the PID data.

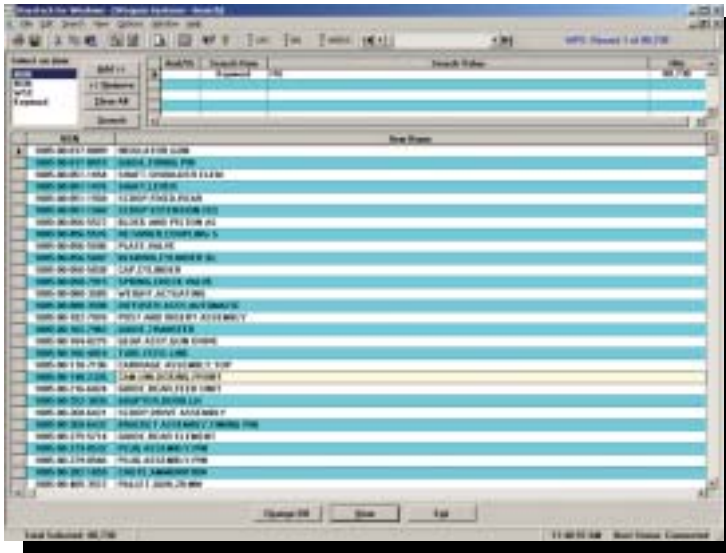

Simply double click on the link to launch the IHS Specs & Standards database and view the document you need. You can now access integrated parts information and standards from your desktop!

- **Our exclusive Source of Supply (SoS) Database** is a valuable resource for locating and qualifying hardware. The fully integrated data and drawings compiled in this source and selection guide represent AN, MS and NAS, and NASM standard components as well as DSCC and SMD drawings, SAE, and metric hardware standards. The data is indexed, searchable, and cross-referenced to National Stock Numbers when applicable.
- **The IHS Universal Parts Center (UPC)** is now integrated within the HAYSTACK application, providing a more efficient searching environment. Access Request for Quotes (RFQs) from commercial vendors and locate government open bid solicitations that are matched against a NSN or company name. This collection represents parts data from the U.S. Government, Canadian Government, CatalogXpress, GSA Catalog and Suppliers, and commercial suppliers.

Note: Access to databases depends on the scope of your current IHS subscription.

- **The NSN and Parts Historical Database** combines the needs of both government and defense contractors to identify and reference parts and NSNs that have fallen out of the FLIS. This collection is very valuable at providing a map from old NSN and part data - to inactive NSN - to alternate sources and technical characteristics data. This mapping is critical to the support of Foreign Military Sales and aging weapon systems.
- **DLA Contractor Technical Data File of Weapon Systems** data provides logistical information on over 485 military weapon systems and support equipment. This data is indexed, searchable, and cross-referenced to National Stock Numbers. Use common weapon system terms to retrieve results.

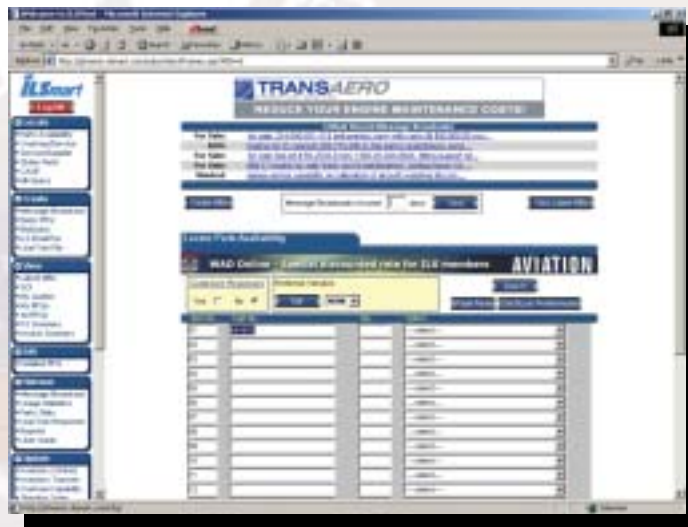

For example, search on "f16" to display all NSNs assigned to that weapon system .

Expand Supply Chain Support with ILS Integration

- **The Inventory Locator Service (ILS)**, the world's largest, most active e-marketplace for the aviation, marine, and defense industries, is now accessible directly from HAYSTACK. With more than 5 billion parts listed, ILS is accessed by subscribers worldwide to buy and sell parts, equipment, and services.

With ILS TurboLink, you can go directly from HAYSTACK to the ILS results page in seconds without having to log in and re-enter any data. ILS TurboLink enables you to complete your research and locate the parts you need - all in one easy step.

Note: The ILS TurboLink is the result of an exclusive partnership between ILS and HAYSTACK and is not available from any other logistics service. Access to ILSmart.com via HAYSTACK requires an active ILS subscription.
